

MINO PEPTIDES

Peptide *Therapy 101*

Everything you need to know about peptides — what they are, how they work, who they are for, and why they matter now.

An educational guide.
Physician-supervised peptide therapy.

What are peptides?

01

You have probably heard the word peptide more in the last year than in your entire life. That is because peptides have moved from the margins of clinical medicine to the center of the wellness, longevity, and weight loss conversation — and for good reason.

Peptide

A short chain of amino acids — typically between 2 and 50 — linked in a specific sequence. Your body produces thousands naturally. They serve as signaling molecules — chemical messengers that tell your cells what to do.

Think of peptides as instruction sets. One tells your pituitary to release growth hormone. Another signals fullness. Another tells damaged tissue to repair. Your body runs on these signals — and as you age, many of them weaken.

Peptide therapy restores those weakening signals using pharmaceutical-grade compounds, prescribed by a physician, and calibrated to your biology.

How do peptides work in the body?

Peptides work by binding to specific receptors on the surface of your cells — like a key fitting into a lock. When the right peptide finds the right receptor, it triggers a specific biological response. This is called receptor-mediated signaling.

Peptide	What It Does	System
BPC-157	Tissue repair & inflammation	Musculoskeletal / gut
CJC-1295 + Ipamorelin	Natural GH release	Growth hormone axis
Thymosin Alpha-1	Immune modulation	Immune system
GHK-Cu	Collagen & skin renewal	Dermal / healing
Semax	Focus & memory	Central nervous system
Tirzepatide	Appetite & metabolism	Metabolic / GLP-1+GIP

Because peptides are naturally occurring and work through your body's existing receptor systems, they tend to have highly targeted effects with fewer off-target side effects compared to many conventional pharmaceuticals.

Is peptide therapy right for me?

03

Peptide therapy is used by a wide range of people — from professional athletes to executives to individuals managing weight or metabolic health. The common thread is a desire to address a specific biological goal with clinical precision.

Low Energy or Poor Sleep

Chronic fatigue, difficulty sleeping, waking unrefreshed, relying on caffeine to function.

Weight Resistance

Difficulty losing weight despite diet and exercise. Metabolic slowdown from aging or hormonal shifts.

Slow Recovery

Nagging injuries, prolonged soreness, joint pain or inflammation limiting activity.

Brain Fog

Difficulty concentrating, forgetfulness, lack of mental sharpness or creative energy.

Aging Skin

Loss of elasticity, thinning skin, fine lines that topical products cannot fully address.

General Decline

The hard-to-describe feeling that your body is not responding the way it once did.

Peptide therapy is not about being sick. It is about closing the gap between how you feel and how you want to feel.

THE OPTIMIZATION PRINCIPLE

What does the process look like?

04

Peptide therapy is a clinical program, not a product you buy off a shelf. Here is what a typical patient journey looks like:

1. Consultation

A physician reviews your health history, symptoms, goals, and current medications to determine whether peptide therapy is appropriate.

2. Baseline Labs

Comprehensive bloodwork establishes your starting point — hormones, metabolic markers, inflammatory markers, organ function.

3. Protocol Design

Your physician selects specific peptides, dosing schedules, and routes based on your labs and goals. Precision medicine.

4. Treatment Begins

Most peptides are subcutaneous injections — a very small needle, similar to insulin. Your clinical team walks you through it.

5. Monitoring

Check-ins at 30, 60, and 90 days. Follow-up labs verify the protocol is working and guide adjustments.

6. Ongoing Optimization

Peptide therapy is a long-term relationship with your biology. Protocols evolve as your body responds.

How do I know it is safe?

05

This is the most important question — and the one that separates legitimate peptide therapy from the gray market. The answer comes down to two things: who prescribes it and where it comes from.

Physician oversight is essential. Peptides should only be used under the supervision of a licensed physician who reviews your health history, prescribes your protocol, and monitors your progress.

Pharmaceutical-Grade (503B)

- FDA-registered facility
- cGMP manufacturing
- Certificate of Analysis
- Chain-of-custody verified
- Prescribed by a physician

Gray Market / Online

- Unregistered suppliers
- No manufacturing oversight
- No testing or documentation
- Unknown sourcing
- Sold without oversight

The difference between pharmaceutical-grade peptide therapy and what you can buy online is the difference between a surgical suite and a back alley.

ON SOURCING

Frequently asked questions

06

Are peptides the same as steroids?

No. Peptides are naturally occurring amino acid chains. Steroids are synthetic hormones. They are fundamentally different in mechanism, effect, and risk.

Are peptides FDA-approved?

Over 100 peptide-based drugs have received FDA approval. Compounded peptides from 503B facilities are manufactured under FDA oversight and cGMP standards.

Do I need to inject myself?

Most peptides are subcutaneous injections — a very small needle, similar to insulin. Most patients say it is painless after the first time. Some are available as nasal sprays or oral formulations.

How quickly will I see results?

Most patients notice improvements in sleep, energy, and well-being within 2–3 weeks. Deeper changes emerge over 30–90 days.

How much does it cost?

Most patients invest \$300–\$500 per month. Your provider can help determine what a program looks like for you.

Can I take peptides with current medications?

This is why physician supervision matters. Your prescribing physician reviews all medications before designing your protocol.

Six categories of transformation

07

Peptide therapy is not a single treatment — it is a portfolio of compounds organized around the outcomes that matter most. Mino Peptides offers 39 pharmaceutical-grade compounds across six therapeutic categories.

Regeneration

BPC-157 · TB-500 · GHK-Cu · Thymosin Beta-4

Tissue repair, recovery, gut healing, inflammation reduction.

Metabolic

Tirzepatide · GLP3-RT · AOD-9604

Weight management, appetite regulation, metabolic recalibration.

Longevity

Epithalon · Thymosin Alpha-1 · FOXO4-DRI

Immune modulation, telomere support, anti-aging at the molecular level.

Performance

CJC-1295 · Ipamorelin · Tesamorelin

Growth hormone optimization, lean mass, faster recovery.

Cognitive

Semax · Selank · Dihexa

Focus, memory, neuroplasticity, long-term cognitive resilience.

Vitality

PT-141 · Kisspeptin

Sexual health, libido, hormonal balance, whole-body vitality.
