

MINO PEPTIDES

The New Science *of You*

A guide to peptide therapy — the physician-supervised science of restoration, optimization, and longevity reshaping modern medicine.

*Pharmaceutical-grade. Physician-supervised.
Calibrated to your biology.*

MINO PEPTIDES LLC

All peptide therapies require a valid prescription from a licensed physician.

Your body already knows how to heal. Peptides remind it.

Peptides are short chains of amino acids — the same building blocks that make up every protein in your body. They act as signaling molecules, carrying instructions between cells: repair this tissue, release that hormone, reduce this inflammation, accelerate that recovery.

Your body produces thousands of peptides naturally. They regulate sleep, metabolism, immune function, cognitive performance, tissue repair, and aging itself. But as we age, peptide production declines — and with it, the signaling that keeps us resilient.

Peptide therapy strategically restores those signals. Using pharmaceutical-grade compounds prescribed by a physician and calibrated to your specific biology, it targets what your body has lost — with the precision of your own biochemistry.

*Over 100 peptide-based therapeutics have received FDA approval.
This is not experimental medicine — it is clinical science reaching
its inflection point.*

FDA-APPROVED PEPTIDE THERAPEUTICS

Energy & Sleep

Peptides like CJC-1295 and Ipamorelin stimulate natural growth hormone release, restoring deep restorative sleep cycles and sustained daytime energy.

Metabolic Optimization

GLP-1 receptor agonists regulate appetite, improve insulin sensitivity, and drive sustainable body composition change under physician supervision.

Regeneration & Recovery

BPC-157 and TB-500 accelerate tissue repair, reduce inflammation, and support musculoskeletal recovery.

Cognitive Clarity

Nootropic peptides like Semax and Selank support focus, reduce brain fog, and promote neuroplasticity.

Skin & Aesthetics

GHK-Cu stimulates collagen synthesis, tightens skin, and accelerates cellular turnover. Regeneration from the inside out.

Longevity & Vitality

Thymosin Alpha-1, Epithalon, and FOXO4-DRI modulate immune function, telomere length, and cellular senescence.

Peptides have left the lab. Every headline proves it.

Three years ago, peptides were a clinical footnote. Today, they are on the cover of TIME, in the policy briefings at Politico, in the beauty pages of Elle, and in the business section of the New York Times.

TIME Magazine published over 30 verified articles on peptides and longevity medicine in 2025–2026 alone. TIME launched TIME Longevity in mid-2025. The category has its own beat.

The New York Times covers peptide market dynamics as a major business story. Politico treats GLP-1 regulation as a premium policy intelligence beat.

The fridge is the new medicine cabinet. Peptide regimens once reserved for Olympic athletes are now part of the daily routine for actors, tech founders, and estheticians.

Americans on GLP-1
by 2030
J.P. Morgan

Over 8% of American adults are already on a GLP-1 medication, and nearly 35% have expressed interest. The U.S. weight loss market reached \$135 billion in 2025.

Eli Lilly became the first healthcare company to reach a trillion-dollar market cap in 2025 — powered by Mounjaro and Zepbound.

For practices, peptide therapy generates \$3,000–\$5,000 per patient per year with 70–80% gross margins. No new equipment, no buildout — just protocols, supply, and the confidence to have the conversation.

Compliance is not a burden. It is a moat.

The regulatory environment for peptides is evolving rapidly — and the practices that invest in compliant sourcing today will be the ones still standing.

The FDA issued 85+ warning letters in September 2025 and resolved GLP-1 shortages, eliminating the legal basis for many compounders.

HHS Secretary Kennedy announced reclassification of 14 peptides from Category 2 to Category 1 in February 2026, expanding legal access to longevity compounds.

Mino Compliance Standards

FDA-registered 503B outsourcing facilities — every compound, every batch

cGMP manufacturing with full Certificate of Analysis documentation

Chain-of-custody verified from raw material through delivery

Beyond-use dating and cold-chain storage protocols

Physician prescribing and clinical oversight for every protocol

Adverse event reporting — clinical-grade pharmacovigilance

Results you can feel in weeks. Transformation in months.

Peptide therapy delivers measurable change. Most patients experience a clear progression of results over time.

Weeks 1–3

Most patients report improvements in sleep quality, energy levels, and overall well-being. Growth hormone pulsatility reactivates. Circadian rhythms optimize.

Weeks 4–8

Deeper effects: body composition shifts, improved recovery, reduced inflammation, enhanced cognitive clarity. GLP-1 patients see meaningful weight reduction.

Days 60–90+

Sustained, visible change — improved body composition, sharper cognition, faster recovery, and a measurable difference in daily performance.

For practices, the retention effect is transformational. Peptide therapy converts a transactional relationship into a longitudinal one — higher lifetime value, deeper trust.

We don't just supply compounds. We build programs.

Mino Peptides exists to make pharmaceutical-grade peptide therapy accessible, compliant, and profitable for practices that refuse to compromise on quality.

Pharmaceutical-Grade Supply

Every compound from FDA-registered 503B facilities. Full COAs, chain-of-custody, beyond-use dating, cold-chain verified.

Clinical Protocol Suite

Dosing guides, reconstitution protocols, injection training, lab templates, monitoring schedules, adverse event workflows.

Staff Training & Scripts

Complete conversation guides for clinical and non-clinical staff. Compliance guardrails built in.

Marketing & Acquisition

Co-branded collateral, social media content, patient education, landing pages, in-office signage.

39 Compounds Across 6 Categories

Regeneration

BPC-157, TB-500, GHK-Cu, Thymosin Beta-4, and tissue repair compounds

Metabolic

Tirzepatide, GLP3-RT, AOD-9604, and metabolic optimization compounds

Longevity

Epithalon, Thymosin Alpha-1, FOXO4-DRI, NAD+, and anti-senescence protocols

Performance

CJC-1295, Ipamorelin, Tesamorelin, and growth hormone secretagogues

Cognitive

Semax, Selank, Dihexa, and nootropic peptides

Vitality

PT-141, Kisspeptin, and sexual health and vitality compounds
